

Why GK Sand Classifiers.

General Kinematics sand classifiers sort sand by AFS grain size. Classifiers separate sand by density, remove dust, and discard waste sand. The remaining “good” sand is distributed by AFS grain size, then can be discharged to be remixed into the AFS grain size required for your process.

Features:

- Separates granular materials based on density.
- Provides a product distribution from a metered flow.
- Multiple discharges allows for product to be re-mixed into whatever AFS grain size required.
- Heavies and lights can be removed from the material stream.
- Air is recirculated, requiring minimal bag house or permitting.
- Can be paired with sand cooling and screening.
